Goals: MC simulation in practice (visually understand & use)

Minimal math = probability
Markov-chain (Metropolis) MC

Monte Carlo Method

- Monte Carlo (MC) method: A computational method that utilizes random numbers
- Major applications of the MC method:
 1. Multidimensional integrations (e.g., statistical mechanics in physics)
 2. Simulation of stochastic natural phenomena (e.g., stock price)

$$\langle A(\{\vec{r}_i\}) \rangle = \frac{\int d\vec{r}_1 \cdots \int d\vec{r}_N \exp(-\frac{V(\{\vec{r}_i\})}{k_B T}) A(\{\vec{r}_i\})}{\int d\vec{r}_1 \cdots \int d\vec{r}_N \exp(-\frac{V(\{\vec{r}_i\})}{k_B T})}$$

Monte Carlo Integration

- Numerical integration

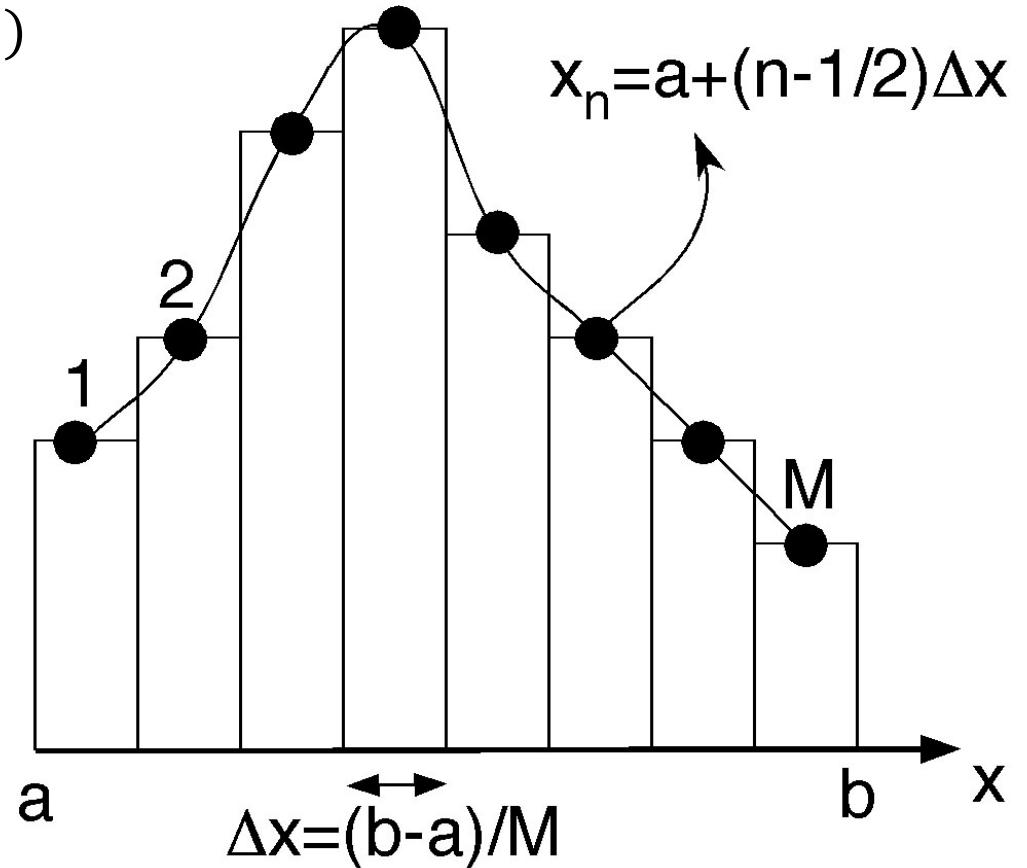

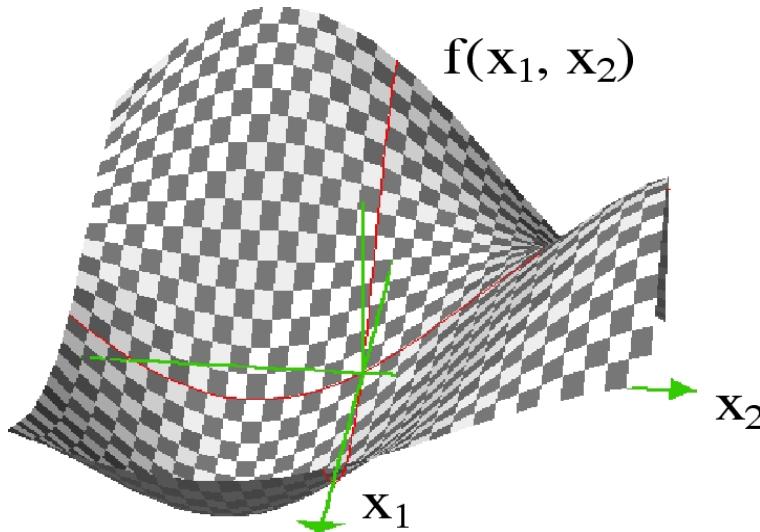

$$\int_a^b dx f(x) = \sum_{n=1}^M \Delta x f(x_n) = \sum_{n=1}^M \frac{b-a}{M} f(x_n)$$

- Monte Carlo integration ($r_n \in [a,b]$: random #): Error $\sim 1/M^{1/2}$

$$\int_a^b dx f(x) \cong \sum_{n=1}^M \frac{b-a}{M} f(r_n)$$

- Multidimensional integration:

$$O(C^N) \int_0^1 dx_1 \cdots \int_0^1 dx_N f(x_1, \dots, x_N)$$

Stochastic Model of Stock Prices

Computational stock portfolio trading

Andrey Omelchenko (Quantlab)

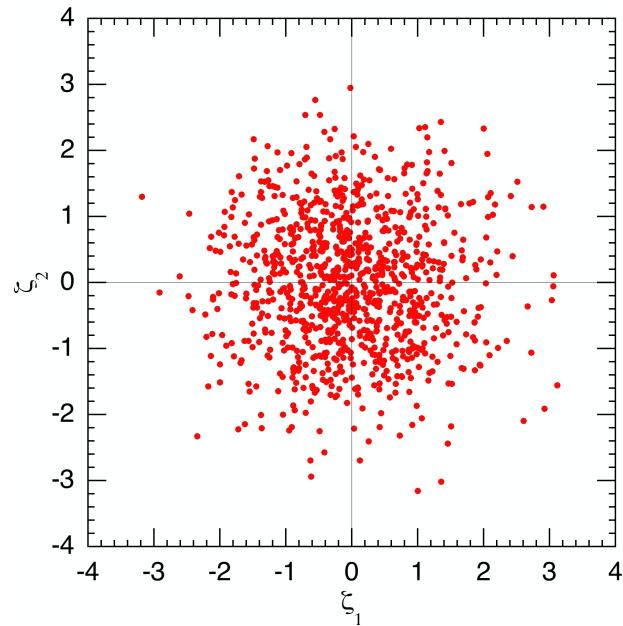

Goals: Monte Carlo Basics

1. Sample-mean MC

$$\int dx f(x) p(x) \cong \bar{f} \pm \sqrt{\frac{\bar{f}^2 - (\bar{f})^2}{M-1}} \quad \left(\bar{f} = \frac{1}{M} \sum_{n=1}^M f(r_n) \right)$$

2. Visualize probability density by a set of points: nonuniform random-number generation by coordinate transformation

$$P'(\zeta_1, \dots, \zeta_N) = \frac{P(r_1, \dots, r_N)}{|\partial(\zeta_1, \dots, \zeta_N)/\partial(r_1, \dots, r_N)|}$$

3. Metropolis (Markov-chain) MC algorithm for importance sampling Random attempt → conditional acceptance with probability $\exp(-\Delta V/k_B T)$

Monte Carlo Integration: Hit-&-Miss

Monte Carlo Integration: Sample Mean

Bottom line: MC simulation as integration

$$\int_a^b dx f(x) \cong \sum_{n=1}^M \frac{b-a}{M} f(r_n) = (b-a) \left[\frac{1}{M} \sum_{n=1}^M f(r_n) \right] = (b-a) \langle f(r_n) \rangle$$

average

$$\left\langle \frac{4}{1+x^2} \right\rangle = \int_0^1 dx \frac{4}{1+x^2} = \int_0^{\pi/4} \frac{d\theta}{\cos^2 \theta} \frac{4}{1+\tan^2 \theta} = \int_0^{\pi/4} 4 d\theta = \pi$$

Sample Mean MC Program

Program mean.c: Calculate π

<https://aiichironakano.github.io/phys516/src/MCbasics/mean.c>

```
#include <stdio.h>
#include <stdlib.h>
main() {
    double x, pi, sum = 0.0;
    int try, ntry;
    printf("Input the number of MC trials\n");
    scanf("%d", &ntry);
    srand((unsigned)time((long *)0));
    for (try=0; try<ntry; try++) {
        x = rand()/(double)RAND_MAX;
        sum += 4.0/(1.0 + x*x);
    }
    pi = sum/ntry;
    printf("MC estimate for PI = %f\n", pi);
}
```

Multidimensional Integration

Statistical mechanics

$$\langle A(\{\vec{r}_i\}) \rangle = \frac{\int d\vec{r}_1 \cdots \int d\vec{r}_N \exp(-\frac{V(\{\vec{r}_i\})}{k_B T}) A(\{\vec{r}_i\})}{\int d\vec{r}_1 \cdots \int d\vec{r}_N \exp(-\frac{V(\{\vec{r}_i\})}{k_B T})}$$

$k_B = 1.38 \times 10^{-16}$ erg/K: Boltzmann constant

$$S = k_B \log W$$

Need Monte Carlo!

Probability: Foundation of MC

Minimal probability theory enough to understand MC simulation

- **Random variable:** A variable that takes different values at different measurements.
- **Probability distribution function**

$$p(x) = (\# \text{ of samples with result } x) / (\text{Total } \# \text{ of samples})$$

- **Normalization**

$$\sum_k p(x_k) = 1$$

- **Expectation (weighted sum)**

$$E[x] = \langle x \rangle = \sum_k x_k p(x_k)$$

- **Variance (spread)**

$$Var[x] = \langle (x - \langle x \rangle)^2 \rangle = \langle x^2 - 2x\langle x \rangle + \langle x \rangle^2 \rangle = \langle x^2 \rangle - \langle x \rangle^2$$

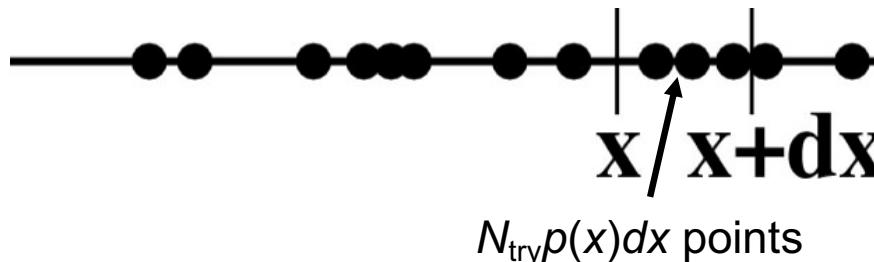

- **Standard deviation**

$$Std[x] = \sqrt{Var[x]}$$

Continuous Random Variables

- Probability “density” function (note the unit)

$p(x)dx = (\# \text{ of samples in the range } [x, x+dx]) / (\text{Total } \# \text{ of samples})$

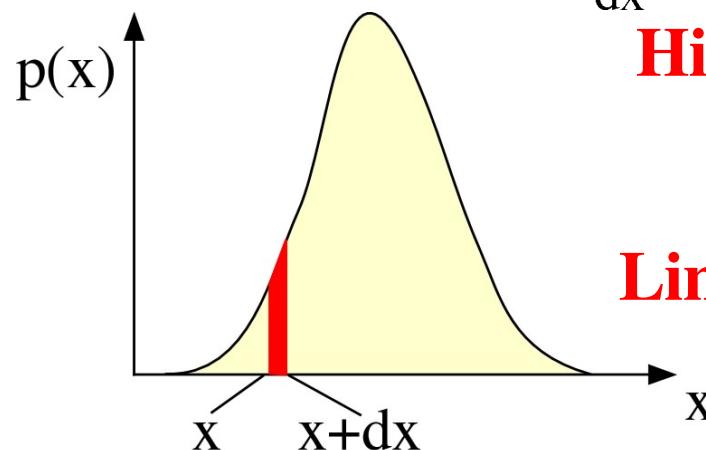

- Normalization

$$\int_{-\infty}^{\infty} dx p(x) = 1 \quad \left(\lim_{\Delta x \rightarrow 0} \sum_k \Delta x p(x_k) = 1 \right)$$

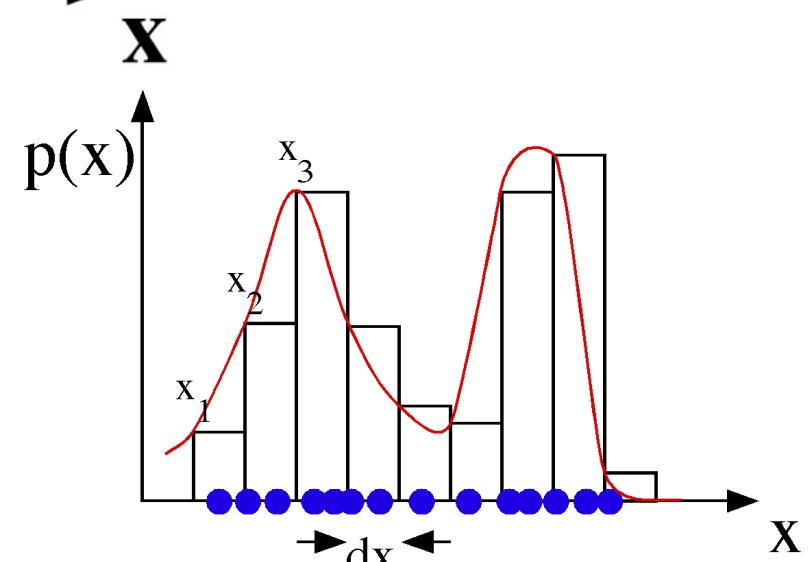

- Expectation

$$E[x] = \langle x \rangle = \int_{-\infty}^{\infty} dx x p(x)$$

Limit: $dx \rightarrow 0$

Visualize!

Histogram

MC Estimation

- Distinguish infinite vs. sample (\sim poll) means

- **Unbiased estimator:** A statistical quantity, using M samples, which converges to the underlying population value for large M
 - The mean of M sampled random variables, $\overline{f(x)}$, converges to its expected value $\langle f(x) \rangle$: $\overline{f(x)}$ is an unbiased estimator of $\langle f(x) \rangle$
 - The error of an MC estimation decreases as $1/M^{1/2}$

Bottom line

Central Theorem of MC Sampling

$$\int dx f(x) p(x) \cong \bar{f} \pm \sqrt{\frac{\bar{f}^2 - (\bar{f})^2}{M-1}}$$

Exact

“Finite” sampling

Proof of the Central Theorem

- Unbiased estimator of the mean

$$E\{\bar{f(x)}\} = \frac{1}{M} \sum_{n=1}^M E\{f(r_n)\} = \frac{1}{M} \sum_{n=1}^M \langle f(x) \rangle = \frac{1}{M} M \langle f(x) \rangle = \langle f(x) \rangle$$

- Error estimate—variance of the sample mean

$$\text{Var}\{\bar{f(x)}\} = \text{Var}\left\{\frac{1}{M} \sum_{n=1}^M f(r_n)\right\} = \frac{1}{M^2} \sum_{m=1}^M \sum_{n=1}^M \langle [f(r_m) - \langle f(x) \rangle][f(r_n) - \langle f(x) \rangle] \rangle$$

For uncorrelated random variables, $\langle AB \rangle = \langle A \rangle \langle B \rangle$, and thus

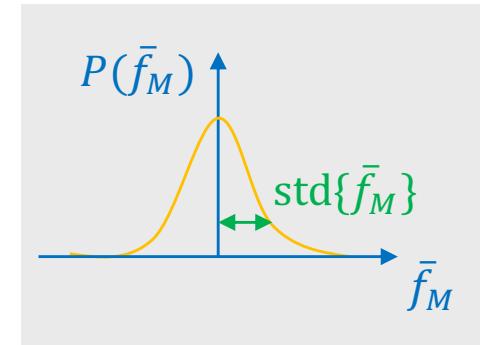

$$\langle [f(r_m) - \langle f(x) \rangle][f(r_n) - \langle f(x) \rangle] \rangle = \begin{cases} \text{Var}\{f(x)\} & (m = n) \\ \langle f(r_m) - \langle f(x) \rangle \rangle \langle f(r_n) - \langle f(x) \rangle \rangle = 0 & (\text{else}) \end{cases}$$

$$\therefore \text{Var}\{\bar{f(x)}\} = \frac{1}{M^2} \sum_{m=1}^M \text{Var}\{f(x)\} = \frac{\text{Var}\{f(x)\}}{M}$$

or $\text{Std}\{\bar{f(x)}\} = \frac{\text{Std}\{f(x)\}}{\sqrt{M}}$

Spread of underlying
mother population

Error bar of poll

Error decreases as $1/M^{1/2}$, but what is the prefactor $\text{Var}\{f(x)\}$?

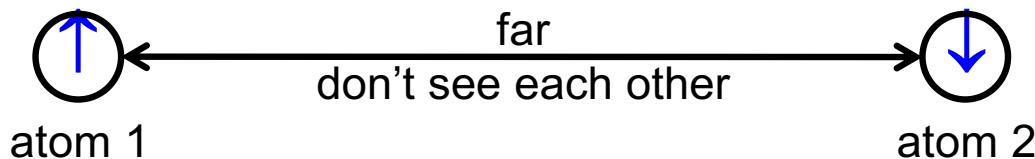

An Example of Correlated Random Variables

- A spin variable, s , takes the value of +1 (spin up, \uparrow) with probability 0.5, & -1 (spin down, \downarrow) with probability 0.5

$$\langle s \rangle = 1 \times \frac{1}{2} + (-1) \times \frac{1}{2} = 0$$

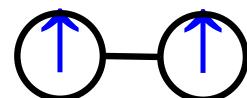

(Uncorrelated spins)

$$\langle s_1 s_2 \rangle = \langle s_1 \rangle \langle s_2 \rangle = 0$$

(Correlated spins) Ferromagnetic spins: they always align with each other
(spin configurations $\uparrow\uparrow$ with probability 0.5 and $\downarrow\downarrow$ with probability 0.5)

$$\langle s_1 s_2 \rangle = 1^2 \times \frac{1}{2} + (-1)^2 \times \frac{1}{2} = 1 \neq \langle s_1 \rangle \langle s_2 \rangle$$

Estimate of the Variance of Sample Mean

- Unbiased estimator of the variance

$$s_M = \frac{1}{M} \sum_{n=1}^M f^2(r_n) - \left[\frac{1}{M} \sum_{n=1}^M f(r_n) \right]^2$$

Experimentally measurable
by finite sampling

$$\begin{aligned}\langle s_M \rangle &= \frac{1}{M} \sum_{n=1}^M \langle f^2(x) \rangle - \frac{1}{M^2} \sum_{m=1}^M \sum_{n=1}^M \langle f(r_m) f(r_n) \rangle \\ &= \langle f^2(x) \rangle - \frac{1}{M^2} \sum_{m=1}^M \langle f^2(x) \rangle - \frac{1}{M^2} \sum_{m=1}^M \sum_{n=1, n \neq m}^M \langle f(r_m) f(r_n) \rangle.\end{aligned}$$

For uncorrelated random variables $\langle f(r_m) f(r_n) \rangle = \langle f(x) \rangle \langle f(x) \rangle$

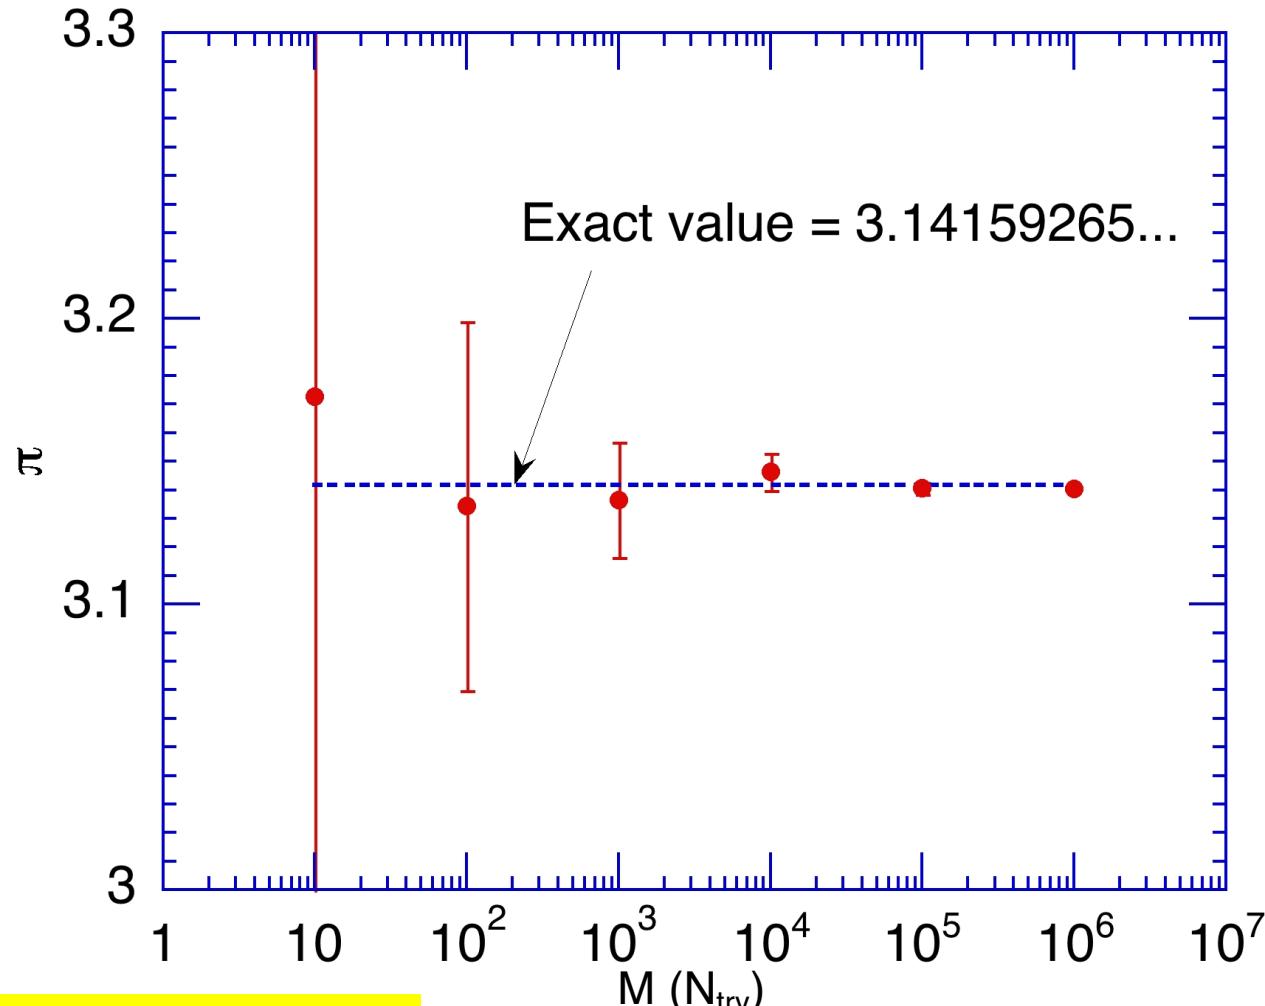

$$\begin{aligned}\langle s_M \rangle &= \left(1 - \frac{1}{M}\right) \langle f^2(x) \rangle - \frac{M(M-1)}{M^2} \langle f(x) \rangle \langle f(x) \rangle \\ &= \frac{M-1}{M} \text{Var}\{f(x)\}\end{aligned}$$

$$\therefore \frac{\langle s_M \rangle}{M-1} \xrightarrow{\text{estimates}} \frac{\text{Var}\{f(x)\}}{M} \xrightarrow{\text{estimates}} \text{Var}\{\bar{f}(x)\}$$

$$\therefore \int dx f(x) p(x) \cong \bar{f} \pm \text{Std}\{\bar{f}\} \cong \bar{f} \pm \frac{\text{Std}\{f(x)\}}{\sqrt{M}} \cong \bar{f} \pm \sqrt{\frac{\bar{f}^2 - (\bar{f})^2}{M-1}}$$

Running mean.c

MC estimation of π : unbiased estimators for the mean & its standard deviation

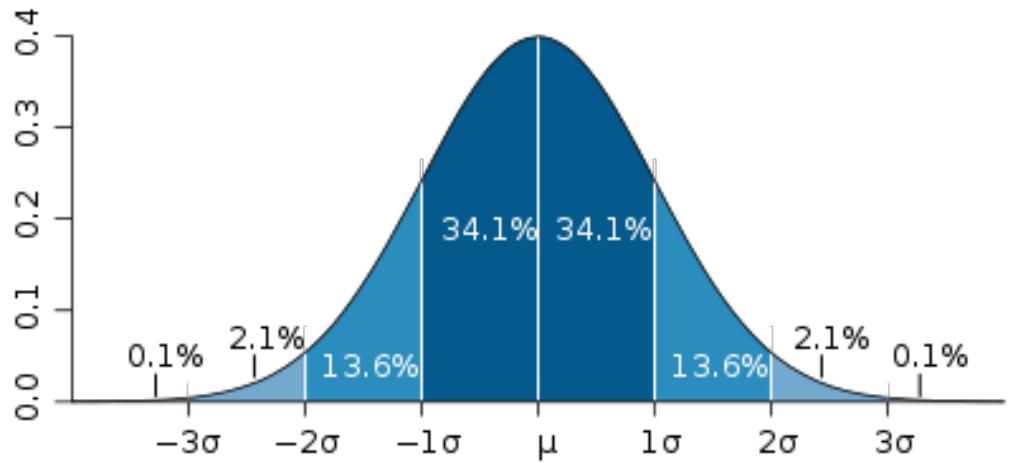

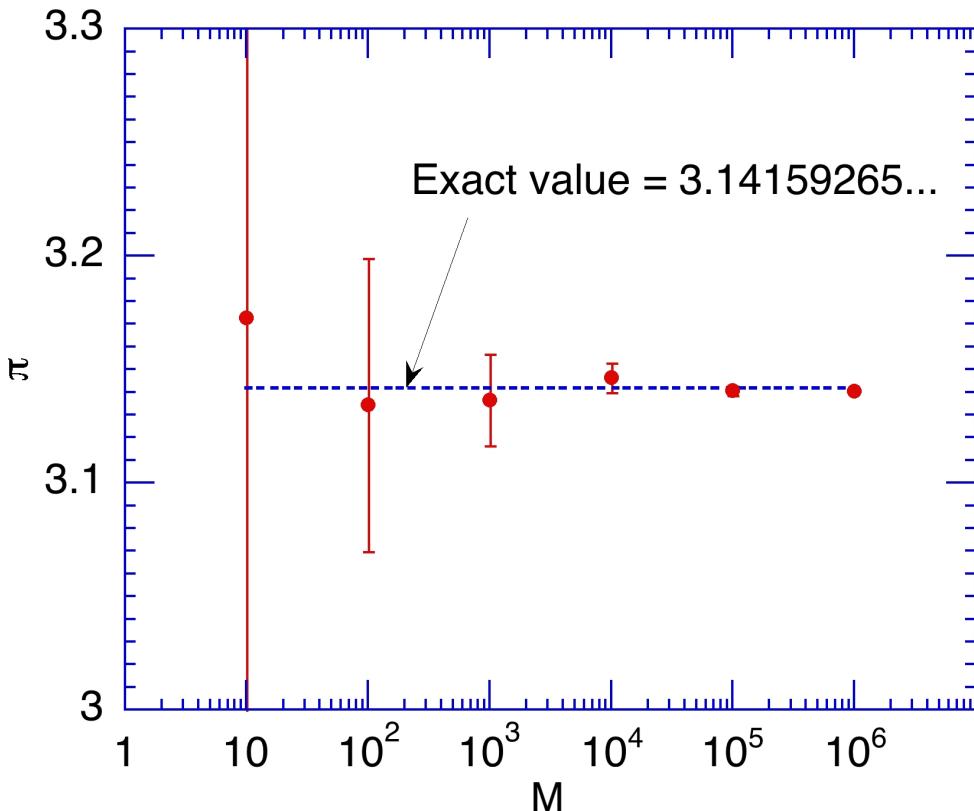

$$\int_0^1 dx f(x) \cong \bar{f} \pm \sqrt{\frac{\bar{f}^2 - (\bar{f})^2}{M-1}}$$

$$\bar{f} = \frac{1}{M} \sum_{n=1}^M f(r_n) \quad \bar{f}^2 = \frac{1}{M} \sum_{n=1}^M f^2(r_n) \quad f(r) = \frac{4}{1+r^2}$$

Error Bar & the Exact Value

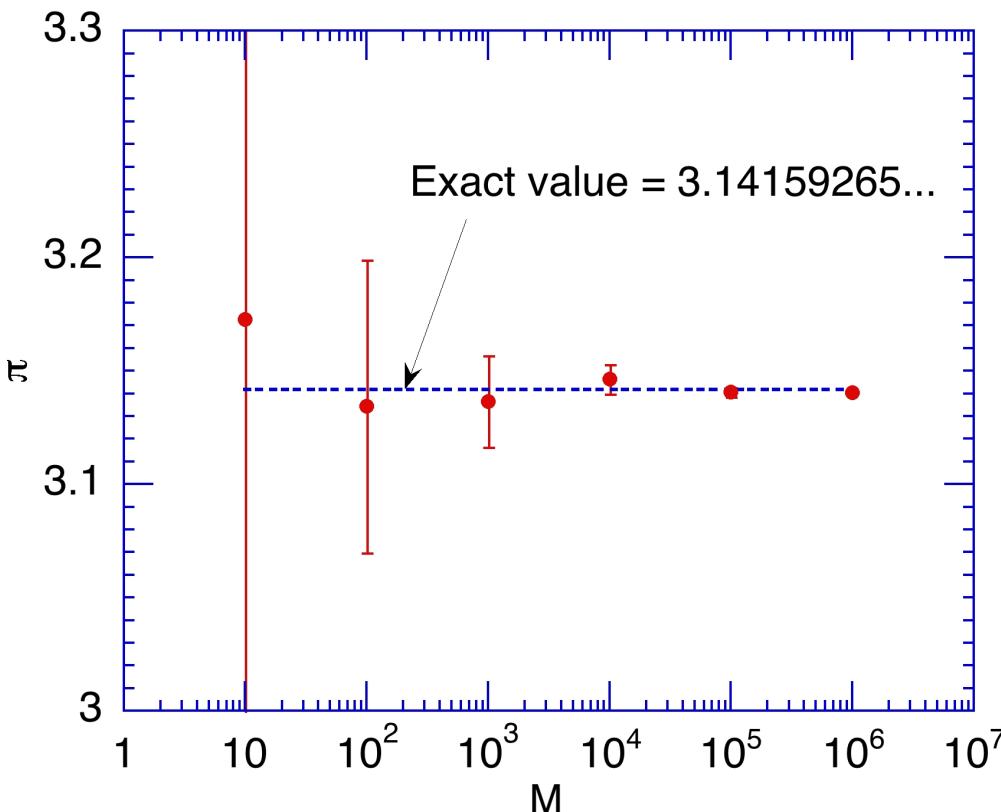

Q: Should the exact value always fall within the error bar?

A: No, only ~68% of the time in the case of the Gaussian distribution

Standard Deviation of mean.c

MC estimation of π : unbiased estimators for the mean & its standard deviation

$$\sigma_M = \sqrt{\frac{1}{N_{\text{seed}}} \sum_{i=1}^{N_{\text{seed}}} \pi_i^2 - \left[\frac{1}{N_{\text{seed}}} \sum_{i=1}^{N_{\text{seed}}} \pi_i \right]^2}$$

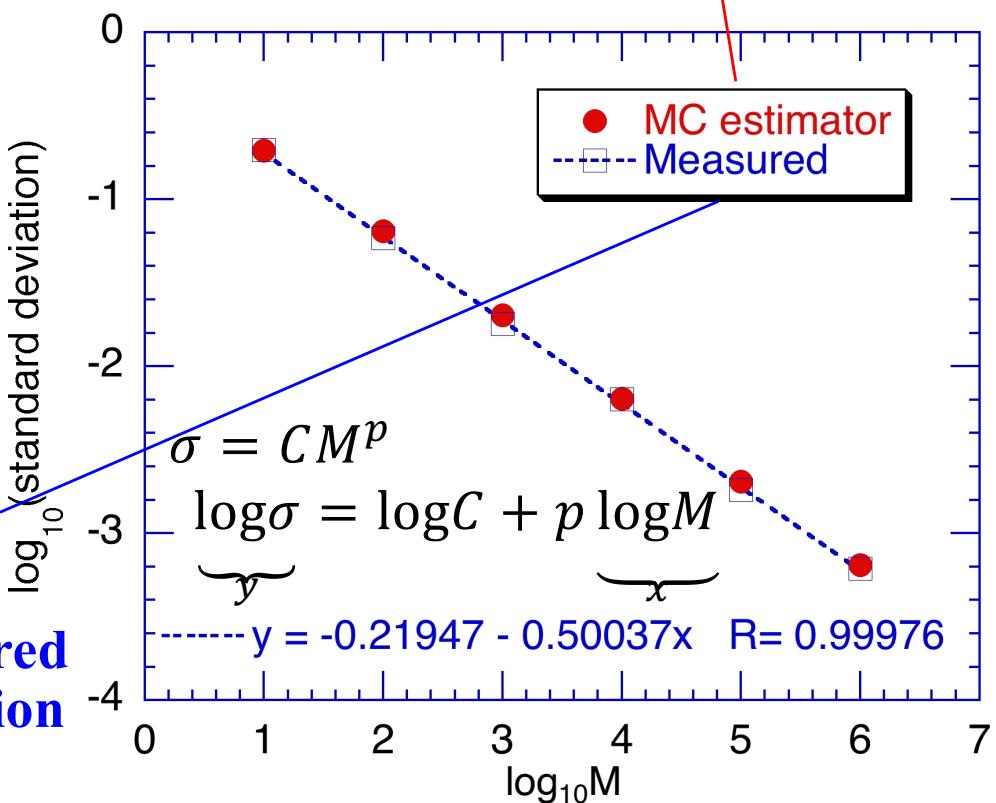

Unbiased estimates & measured values of the standard deviation

See lecture on least square fit

$$\int_0^1 dx f(x) \cong \bar{f} \pm \sqrt{\frac{\bar{f}^2 - (\bar{f})^2}{M-1}}$$

$$\bar{f} = \frac{1}{M} \sum_{n=1}^M f(r_n) \quad \bar{f}^2 = \frac{1}{M} \sum_{n=1}^M f^2(r_n)$$

$$f(x) = 4 / (1 + x^2)$$

Random Number Generation

- **Uniform random number generator:** A routine to generate a sequence of random numbers within a specified range (typically [0,1])
- **Linear congruential generator:** Generates a sequence X_i of positive integers based on recursion

$$X_{i+1} = aX_i \bmod M$$

in the range $[1, M-1]$ & generates a random number in the range $[0,1]$ as

$$r_i = X_i/M$$

(Example) $M = 7$

Good: $a = 3$

$$X_{i+1} = 3X_i \bmod 7$$

i	X_i
1	1
2	3
3	2
4	6
5	4
6	5
7	1

Period $M-1 = 6$

Bad: $a = 2$

$$X_{i+1} = 2X_i \bmod 7$$

i	X_i
1	1
2	2
3	4
4	1

Period $3 < M-1$

Linear Congruential Generator

- Most common generator: cycle ~ 2 billion

$$(M, a) = (2^{31} - 1 = 2147483647, 7^5 = 16807)$$

- Overflow avoidance algorithm (using 32-bit integer arithmetic)

Let $M = aq + r$, i.e., $q = [M/a]$, $r = M \bmod a$ then

$$az \bmod M = \begin{cases} a(z \bmod q) - r[z/q] & \text{if } \geq 0 \\ a(z \bmod q) - r[z/q] + M & \text{otherwise} \end{cases}$$

```
#define IA 16807
#define IM 2147483647
#define AM (1.0/IM)
#define IQ 127773
#define IR 2836
float ran0(int *idum) {
    long k;
    float ans;

    k = (*idum)/IQ;
    *idum = IA*(*idum - k*IQ) - IR*k;
    if (*idum < 0) *idum += IM;
    ans = AM*(*idum);
    return ans;
}
```

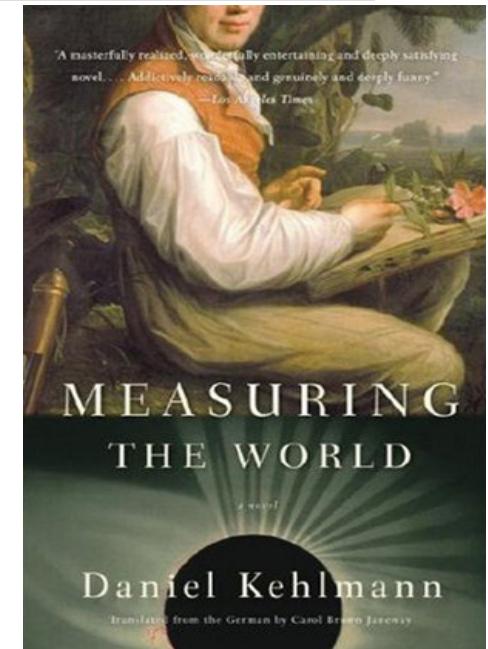

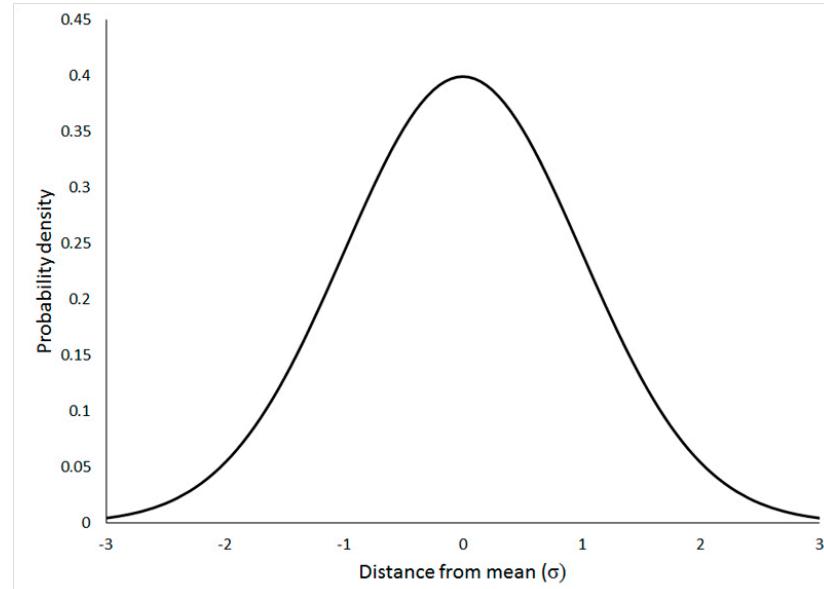

Gaussian (Normal) Distribution

$$\rho(\xi) = \sqrt{\frac{1}{2\pi}} \exp\left(-\frac{\xi^2}{2}\right)$$

$$\int_{-\infty}^{\infty} d\xi \rho(\xi) = 1$$

$$Var\{\xi\} = \int_{-\infty}^{\infty} d\xi \xi^2 \rho(\xi) = 1$$

See Appendix A & problem in [MC Basics lecture](#)

Let's use coordinate transformation to generate nonuniform random numbers

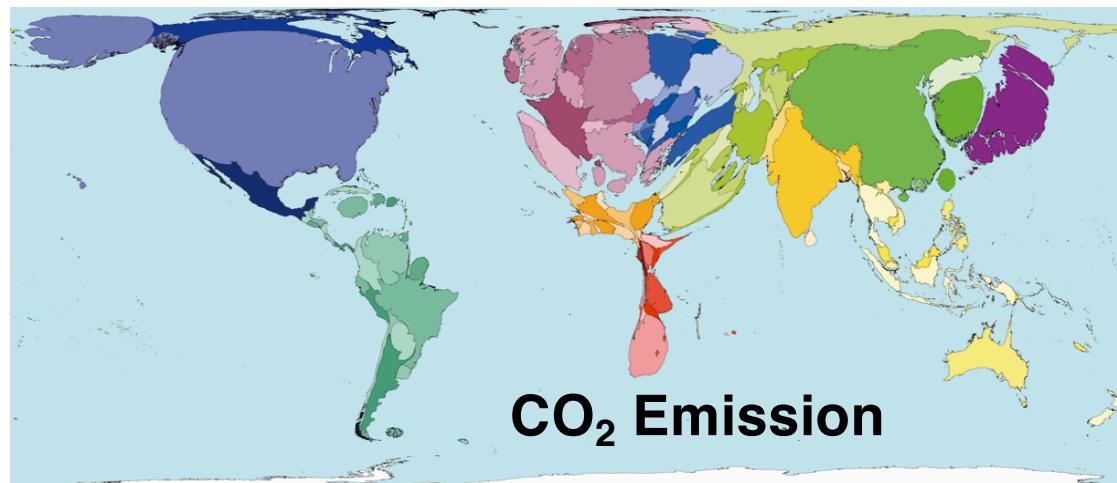

Greenland Phenomenon

Spherical coordinate system (latitude, θ & longitude, ϕ) is curved

Transformation Method

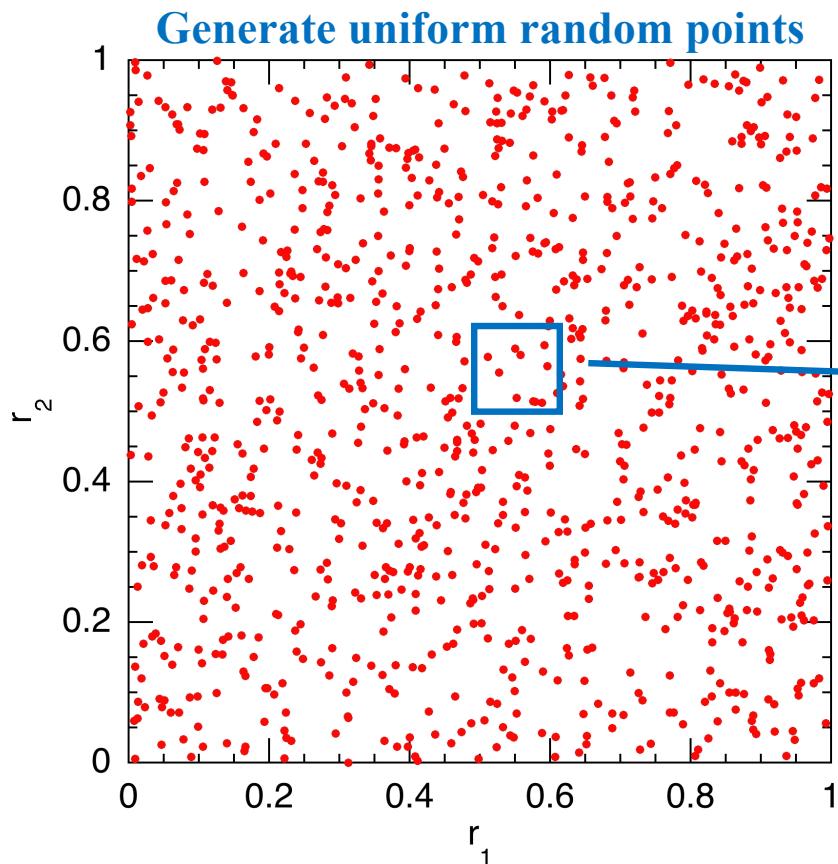

Uniformly generate population in these distorted maps
to generate nonuniform distributions

Box-Muller Transformation

Uniform

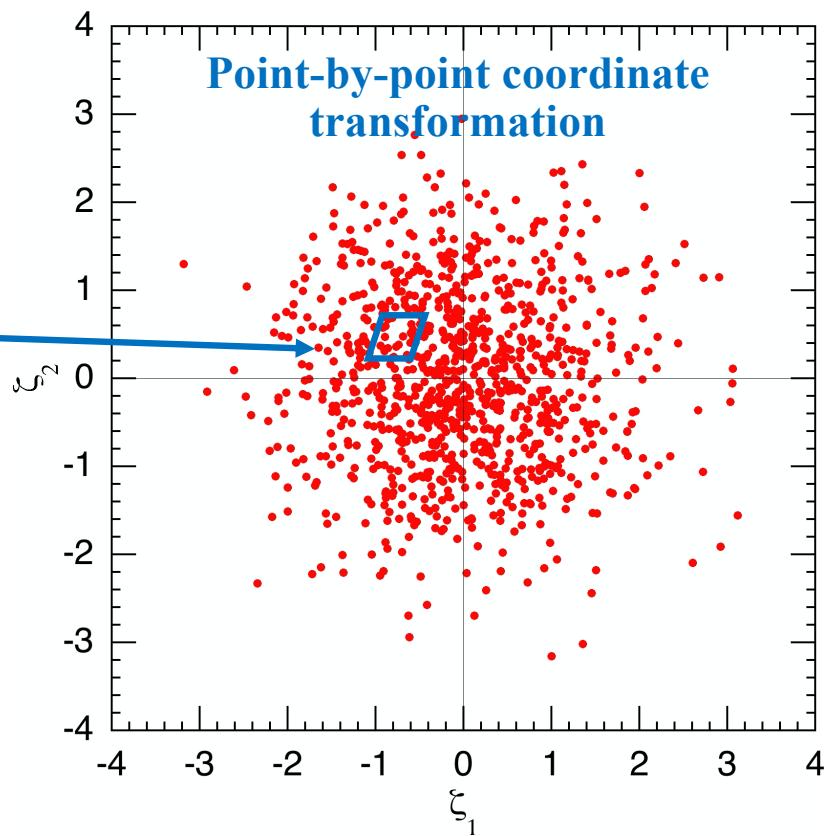

$$r_1, r_2 \in [0,1]$$

$$P(r_1, r_2) = 1$$

Non-uniform

$$\begin{cases} \xi_1 = \sqrt{-2 \ln r_1} \cos(2\pi r_2) \\ \xi_2 = \sqrt{-2 \ln r_1} \sin(2\pi r_2) \end{cases}$$

$$P(\xi_{1/2}) = \sqrt{\frac{1}{2\pi}} \exp\left(-\frac{\xi_{1/2}^2}{2}\right)$$

Box-Muller Algorithm

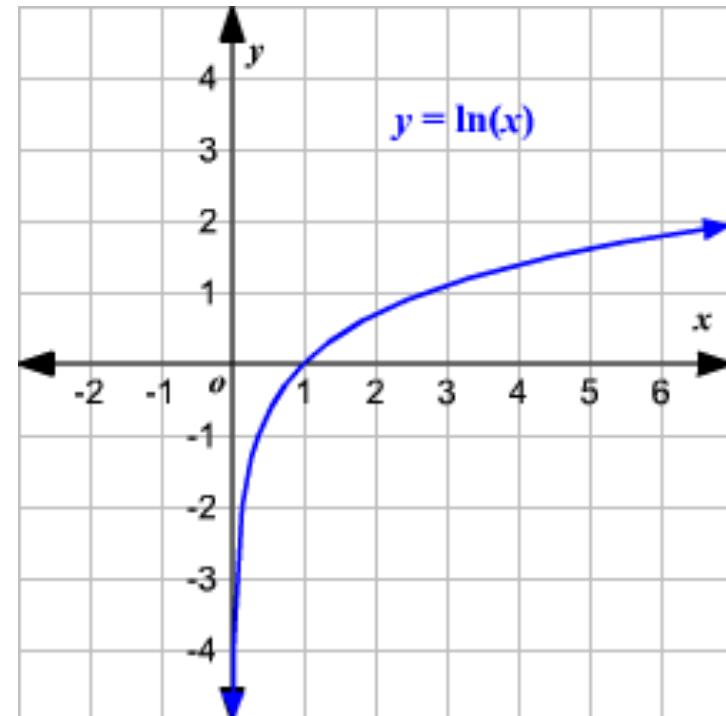

Uniform random number $\in [0,1]$

```
r1 = rand()/(double)RAND_MAX; // cast  
r2 = rand()/(double)RAND_MAX;  
z = sqrt(-2*log(r1))*cos(2*M_PI*r2);
```

π in C math library

cf. Polar coordinate

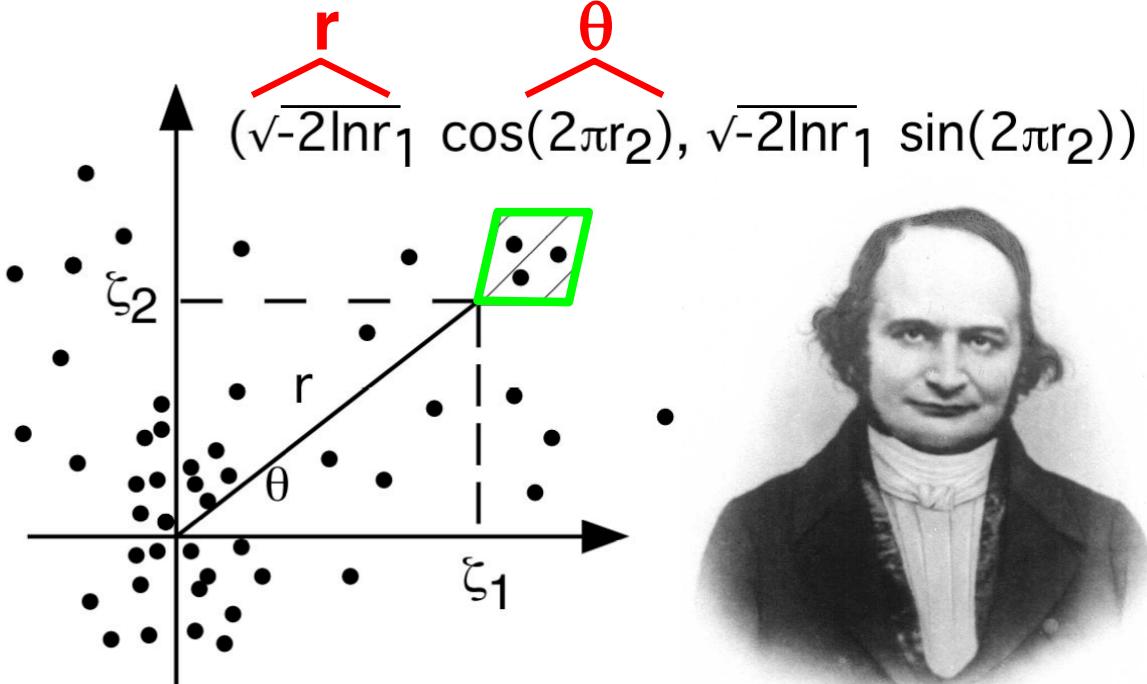

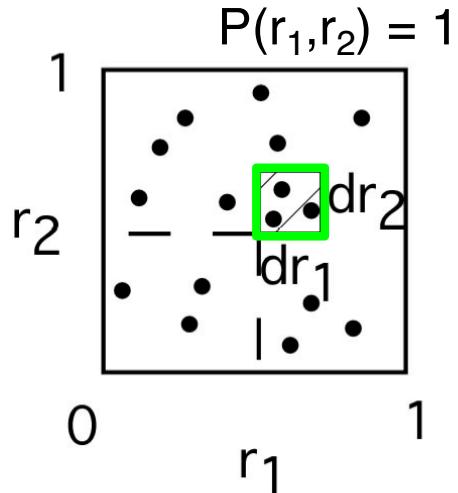

$$\begin{cases} r = \sqrt{-2\ln r_1} \in [0, \infty] \\ \theta = 2\pi r_2 \in [0, 2\pi] \end{cases}$$

Nonuniform Random Numbers

Coordinate transformation method

Uniform random number

total sample size

Number of samples: $N \underbrace{P(r_1, r_2) dr_1 dr_2}_{1} = N \times \boxed{P'(\zeta_1, \zeta_2)} \boxed{S(r_1, r_2, dr_1, dr_2)}$

density area

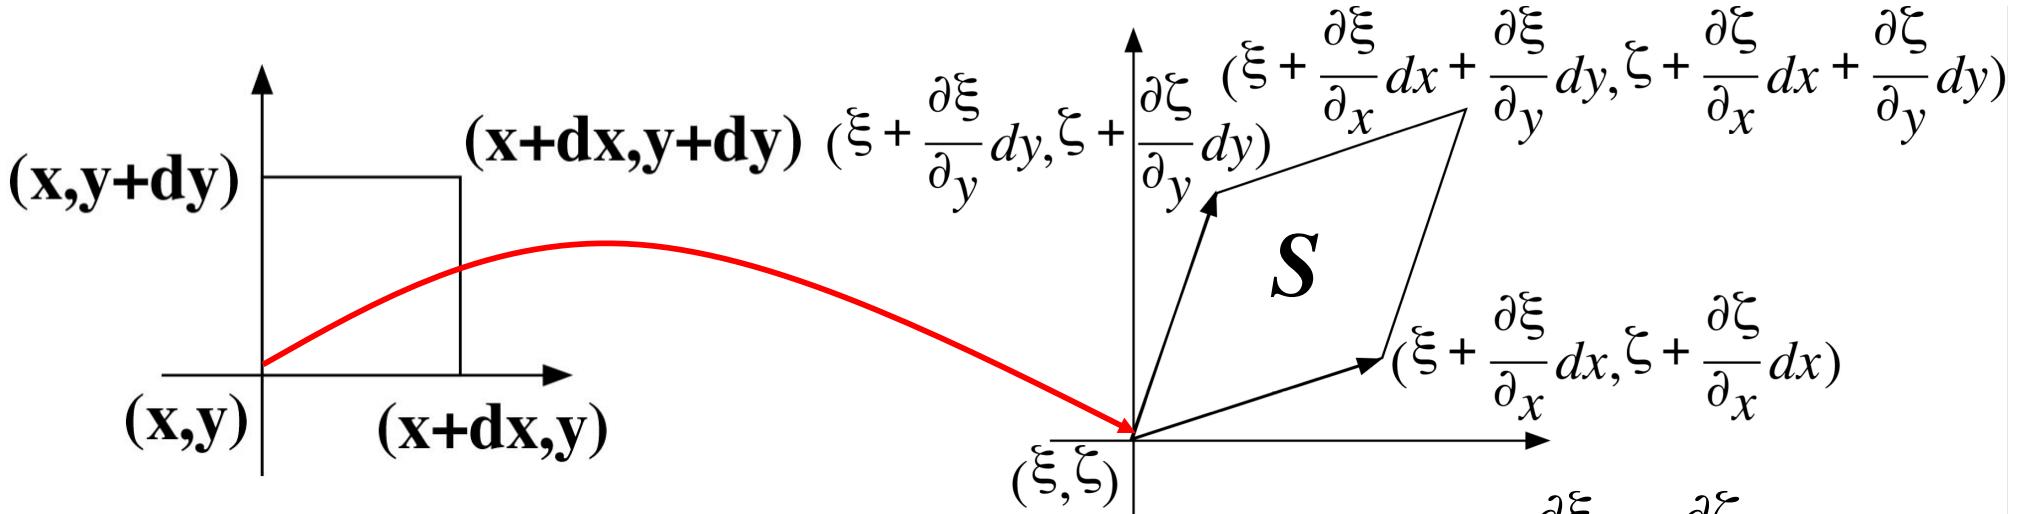

Areal transformation: $S = \left| \frac{\partial(\zeta_1, \zeta_2)}{\partial(r_1, r_2)} \right| dr_1 dr_2$

<https://aiichironakano.github.io/phys516/JacobianInversion.pdf>

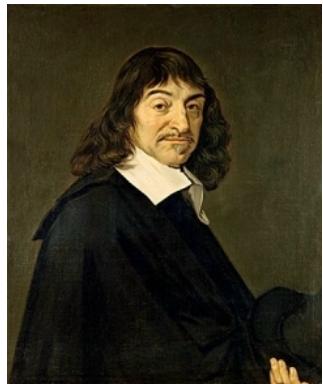

$$\therefore P'(\zeta_1, \zeta_2) = \left| \frac{\partial(\zeta_1, \zeta_2)}{\partial(r_1, r_2)} \right|^{-1} \underbrace{P(r_1, r_2)}_{1} = \left| \frac{\partial(r_1, r_2)}{\partial(\zeta_1, \zeta_2)} \right|$$

Jacobian = areal scaling

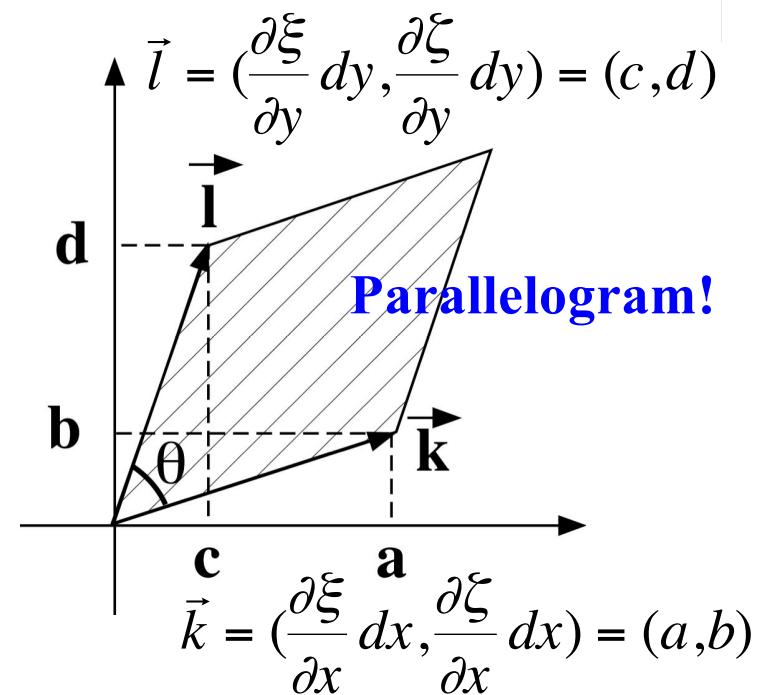

Areal Transformation

$$S = \begin{vmatrix} \frac{\partial \xi}{\partial x} & \frac{\partial \xi}{\partial y} \\ \frac{\partial \zeta}{\partial x} & \frac{\partial \zeta}{\partial y} \end{vmatrix} dxdy = \left(\frac{\partial \xi}{\partial x} \frac{\partial \zeta}{\partial y} - \frac{\partial \xi}{\partial y} \frac{\partial \zeta}{\partial x} \right) dxdy$$

See Appendix B in [MC Basics lecture](#)

$$S = |\vec{k}| |\vec{l}| \sin \theta = \sqrt{a^2 + b^2} \sqrt{c^2 + d^2} \sin \theta = |ad - bc|$$

Multidimensional Integration

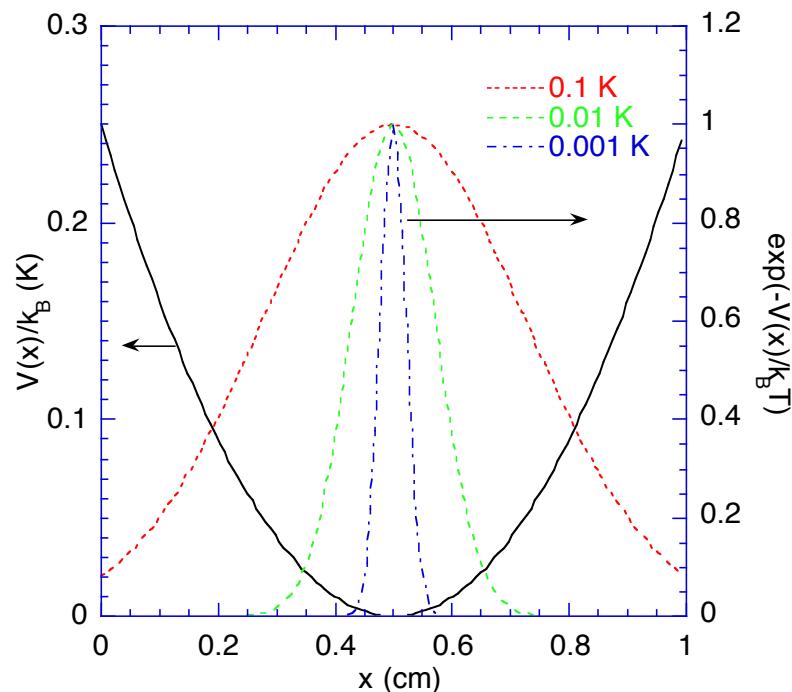

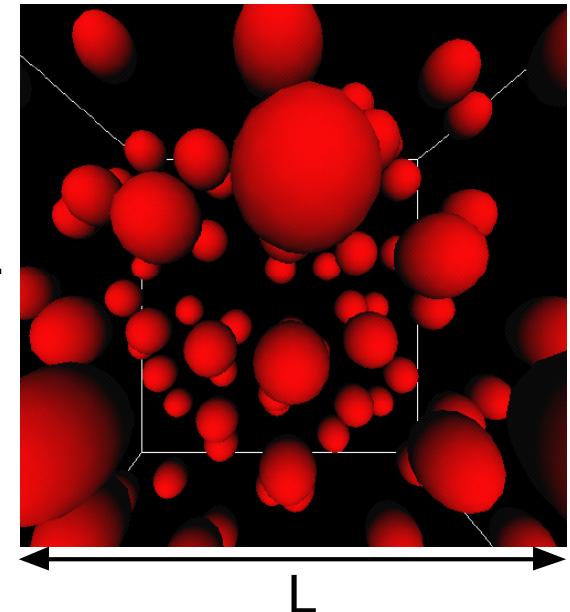

Statistical mechanics

$$\langle A(\{\vec{r}_i\}) \rangle = \frac{\int d\vec{r}_1 \cdots \int d\vec{r}_N \exp(-\frac{V(\{\vec{r}_i\})}{k_B T}) A(\{\vec{r}_i\})}{\int d\vec{r}_1 \cdots \int d\vec{r}_N \exp(-\frac{V(\{\vec{r}_i\})}{k_B T})}$$

$k_B = 1.38 \times 10^{-16}$ erg/K: Boltzmann constant

$$S = k_B \log W$$

Need importance sampling!
(Example: harmonic oscillators)

$0.2^{100} = 1.3 \times 10^{-70}$ for 100 oscillators

Importance Sampling

(Problem) How to generate $3N$ -dimensional sample points according to the Boltzmann probability distribution?

$$\langle A \rangle = \frac{\int d\vec{r}^N A(\vec{r}^N) \exp(-V(\vec{r}^N)/k_B T)}{\int d\vec{r}^N \exp(-V(\vec{r}^N)/k_B T)} \approx \frac{\sum_{n=1}^M A(\vec{r}^N_n) \exp(-V(\vec{r}^N_n)/k_B T)}{\sum_{n=1}^M \exp(-V(\vec{r}^N_n)/k_B T)}$$

- **Importance sampling:** Chooses a sequence of random numbers from a probability density function, $p(\vec{r})$
- **Markov chain:** A sequence of trials that satisfies
 - (a) The outcome of each trial belongs to a finite set of outcomes, $\{\Gamma_1, \Gamma_2, \dots, \Gamma_N\}$, called the state space
 - (b) The outcome of each trial depends only on the outcome of the trial that immediately precedes it
- **Transition probability matrix:** Its element π_{mn} is the conditional probability that the next state is Γ_m given that the current state is Γ_n , i.e., the probability of state transition, $n \rightarrow m$

$$p_m^{(\tau)} = \sum_{n=1}^N \pi_{mn} p_n^{(\tau-1)}$$

Markov Chain

- **Normalization:** Given that the system is in the state, Γ_n , then the next state must be one of the N possible states

$$\sum_{m=1}^N \pi_{mn} = 1$$

- **Matrix-vector notation**

$$\Pi = \begin{bmatrix} \pi_{11} & \pi_{12} & \cdots & \pi_{1N} \\ \pi_{21} & \pi_{22} & & \\ \vdots & & \ddots & \\ \pi_{N1} & & & \pi_{NN} \end{bmatrix} \quad \rho^{(\tau)} = \begin{pmatrix} p_1^{(\tau)} \\ p_2^{(\tau)} \\ \vdots \\ p_N^{(\tau)} \end{pmatrix}$$

$$\rho^{(\tau)} = \Pi \rho^{(\tau-1)} = \Pi^2 \rho^{(\tau-2)} = \dots = \Pi^\tau \rho^{(0)}$$

Andrey Markov
(1856-1922)

(Perron-Frobenius theorem) Eigenvalues: $\Pi \rho_\nu = \varepsilon_\nu \rho_\nu \quad (\varepsilon_1 = 1, |\varepsilon_2|, \dots, |\varepsilon_N| < 1)$

1. Fixed point: $\Pi \rho_1 = \rho_1$

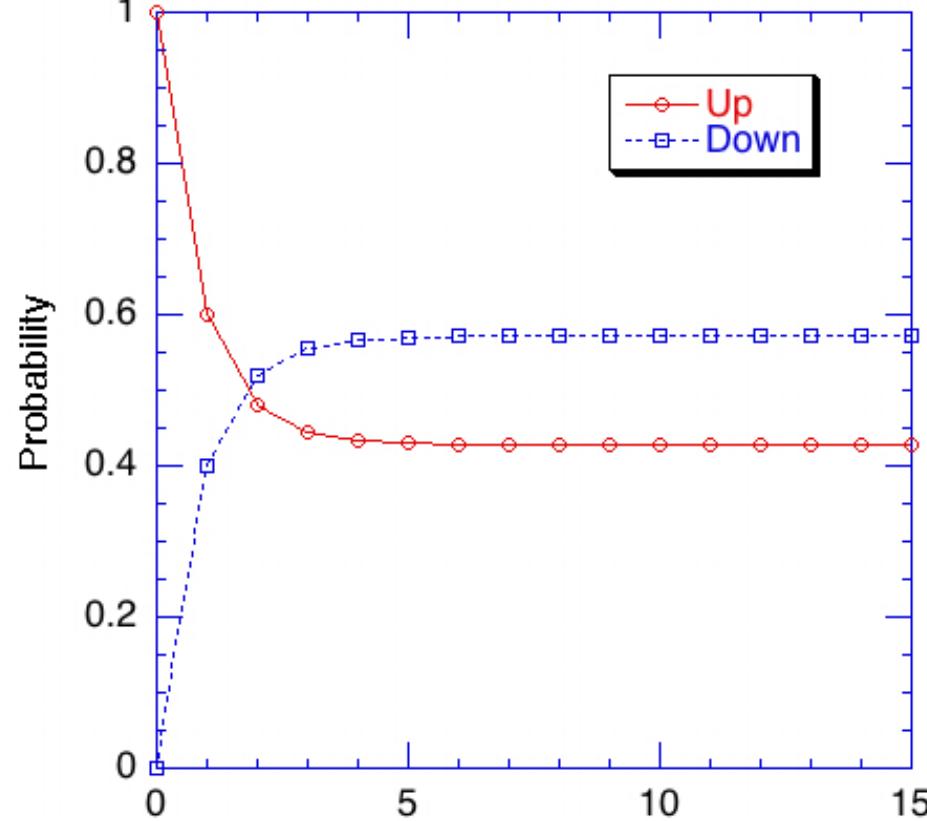

2. Filter: $\Pi^\tau \left(\sum_{\nu=1}^N c_\nu \rho_\nu \right) = \sum_{\nu=1}^N c_\nu \varepsilon^\nu \rho_\nu \xrightarrow{\tau \rightarrow \infty} c_1 \rho_1$

Oskar Perron
(1880–1975)
Ferdinand G. Frobenius
(1849–1917)

Example: Two-Level System

$$\Pi = \begin{pmatrix} \uparrow & \downarrow \\ \downarrow & \uparrow \end{pmatrix} = \begin{pmatrix} a & 1-b \\ 1-a & b \end{pmatrix} = \begin{pmatrix} 0.6 & 0.3 \\ 0.4 & 0.7 \end{pmatrix} \quad (a = 0.6, b = 0.7)$$

$$\begin{pmatrix} p_{\uparrow}^{(\tau)} \\ p_{\downarrow}^{(\tau)} \end{pmatrix} = \begin{pmatrix} 0.6 & 0.3 \\ 0.4 & 0.7 \end{pmatrix}^{\tau} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \xrightarrow[\tau \rightarrow \infty]{} \begin{pmatrix} 0.4286 \\ 0.5714 \end{pmatrix}$$

Eigenvalue Problem

- **Eigensystem** $\Pi w = \lambda w$ $w = \begin{pmatrix} u \\ v \end{pmatrix}$
$$\begin{pmatrix} a & 1-b \\ 1-a & b \end{pmatrix} \begin{pmatrix} u \\ v \end{pmatrix} = \lambda \begin{pmatrix} u \\ v \end{pmatrix} \quad \text{or} \quad \begin{pmatrix} \lambda - a & b-1 \\ a-1 & \lambda - b \end{pmatrix} \begin{pmatrix} u \\ v \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

- For a nontrivial (other than $u = v = 0$) solution, $(\Pi - \lambda I)^{-1}$ should not exist

$$|\Pi - \lambda I| = (\lambda - a)(\lambda - b) - (a - 1)(b - 1) = (\lambda - a - b + 1)(\lambda - 1) = 0$$

- **Eigenvalues:** $\lambda_+ = 1$ and $-1 < \lambda_- = a+b-1 < 1$ **Perron-Frobenius!**
for a positive matrix: $a, b > 0$

- **Eigenvectors:**

$$w_+ = \begin{pmatrix} u_+ \\ v_+ \end{pmatrix} = \frac{1}{2-a-b} \begin{pmatrix} 1-b \\ 1-a \end{pmatrix} \quad \text{and} \quad w_- = \begin{pmatrix} u_- \\ v_- \end{pmatrix} = \begin{pmatrix} -1 \\ 1 \end{pmatrix}$$

Telescopic Technique

$$\begin{cases} \Pi \begin{pmatrix} u_+ \\ v_+ \end{pmatrix} = \lambda_+ \begin{pmatrix} u_+ \\ v_+ \end{pmatrix} \\ \Pi \begin{pmatrix} u_- \\ v_- \end{pmatrix} = \lambda_- \begin{pmatrix} u_- \\ v_- \end{pmatrix} \end{cases} \quad \text{or} \quad \begin{pmatrix} \Pi_{11} & \Pi_{12} \\ \Pi_{21} & \Pi_{22} \end{pmatrix} \begin{pmatrix} U \\ V \end{pmatrix} = \begin{pmatrix} u_+ & u_- \\ v_+ & v_- \end{pmatrix} \begin{pmatrix} \Lambda \\ \Lambda \end{pmatrix} = \begin{pmatrix} u_+ & u_- \\ v_+ & v_- \end{pmatrix} \begin{pmatrix} \lambda_+ & 0 \\ 0 & \lambda_- \end{pmatrix}$$

$$\Pi U = U \Lambda \quad \text{or} \quad \Pi = U \Lambda U^{-1} \quad \text{Eigen decomposition}$$

$$\begin{pmatrix} p_1^{(n)} \\ p_2^{(n)} \end{pmatrix} = \Pi^n \begin{pmatrix} p_1 \\ p_2 \end{pmatrix} = U \Lambda U^{-1} U \Lambda U^{-1} \dots U \Lambda U^{-1} \begin{pmatrix} p_1 \\ p_2 \end{pmatrix} = U \boxed{\Lambda^n} U^{-1} \begin{pmatrix} p_1 \\ p_2 \end{pmatrix}$$

$$\boxed{\begin{pmatrix} \lambda_+^n & 0 \\ 0 & \lambda_-^n \end{pmatrix} \xrightarrow{n \rightarrow \infty} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}}$$

$$\begin{pmatrix} p_1^{(n)} \\ p_2^{(n)} \end{pmatrix} = \Pi^n \begin{pmatrix} p_1 \\ p_2 \end{pmatrix} \xrightarrow{n \rightarrow \infty} \begin{pmatrix} u_+ \\ v_+ \end{pmatrix} = \begin{pmatrix} \frac{1-b}{2-a-b} \\ \frac{1-a}{2-a-b} \end{pmatrix} = \begin{pmatrix} 0.3/0.7 = 0.4286 \\ 0.4/0.7 = 0.5714 \end{pmatrix}$$

Perron-Frobenius theorem!

Detailed Balance Condition

- Perron-Frobenius theorem → repeated application of Π converges to its eigenvector, ρ , with eigenvalue 1

$$\rho^{(\tau)} = \Pi^\tau \rho^{(\tau=0)} \xrightarrow[\tau \rightarrow \infty]{} \rho$$

where $\Pi\rho = \rho$ or $\sum_{n=1}^N \Pi_{mn} \rho_n = \rho_m$

(Inverse problem = importance sampling) Find a transition probability matrix Π whose 1st eigenvector equals a given ρ , e.g.,

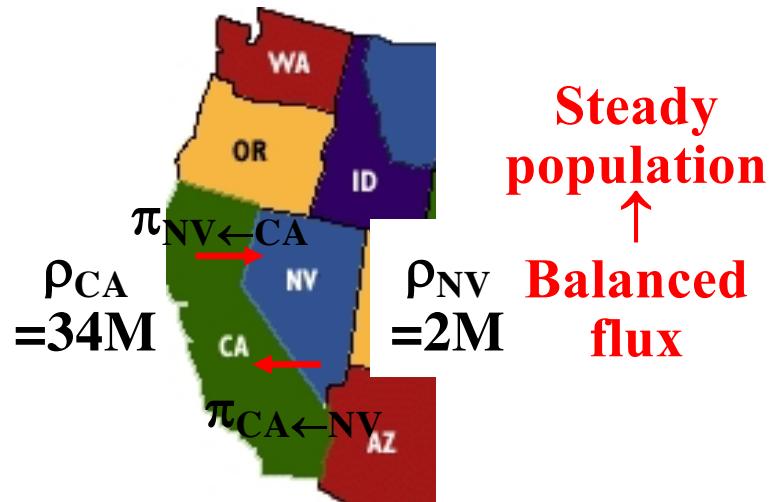

$$\rho_n = \frac{\exp(-V_n / k_B T)}{\sum_n \exp(-V_n / k_B T)}$$

(Solution = detailed balance condition) Let Π satisfy, for any pair of states,

$$\pi_{mn} \rho_n = \pi_{nm} \rho_m$$

then $\sum_{n=1}^N \pi_{mn} \rho_n = \rho_m$.

$$\therefore \sum_{n=1}^N \pi_{mn} \rho_n = \boxed{\sum_{n=1}^N (\pi_{nm})} \rho_m$$

Metropolis Algorithm

(Problem) Find a transition probability matrix Π that satisfies the detailed balance condition for a given ρ :

$$\pi_{mn}\rho_n = \pi_{nm}\rho_m$$

(Solution) Let $\alpha_{mn} = \alpha_{nm}$ be a symmetric attempt matrix, then

$$\pi_{mn} = \begin{cases} \alpha_{mn} & \rho_m \geq \rho_n \quad m \neq n \\ (\rho_m / \rho_n)\alpha_{mn} & \rho_m < \rho_n \quad m \neq n \\ 1 - \sum_{m' \neq n} \pi_{m'n} & m = n \end{cases}$$

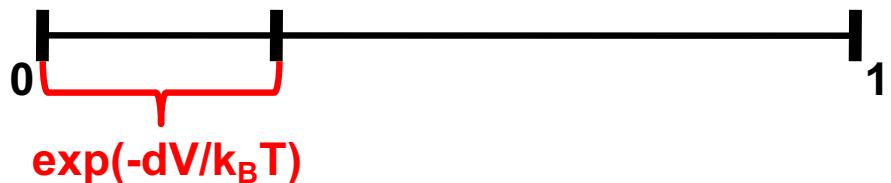

(Example) Statistical mechanics: no need for the absolute weight!

$$\frac{P(\{\vec{r}_i^{\text{next}}\})}{P(\{\vec{r}_i^{\text{current}}\})} = \frac{\exp(-V(\{\vec{r}_i^{\text{next}}\})/k_B T)}{\exp(-V(\{\vec{r}_i^{\text{current}}\})/k_B T)} = \exp(-\delta V(\{\vec{r}_i^{\text{next}}\}, \{\vec{r}_i^{\text{current}}\})/k_B T)$$

Metropolis Algorithm

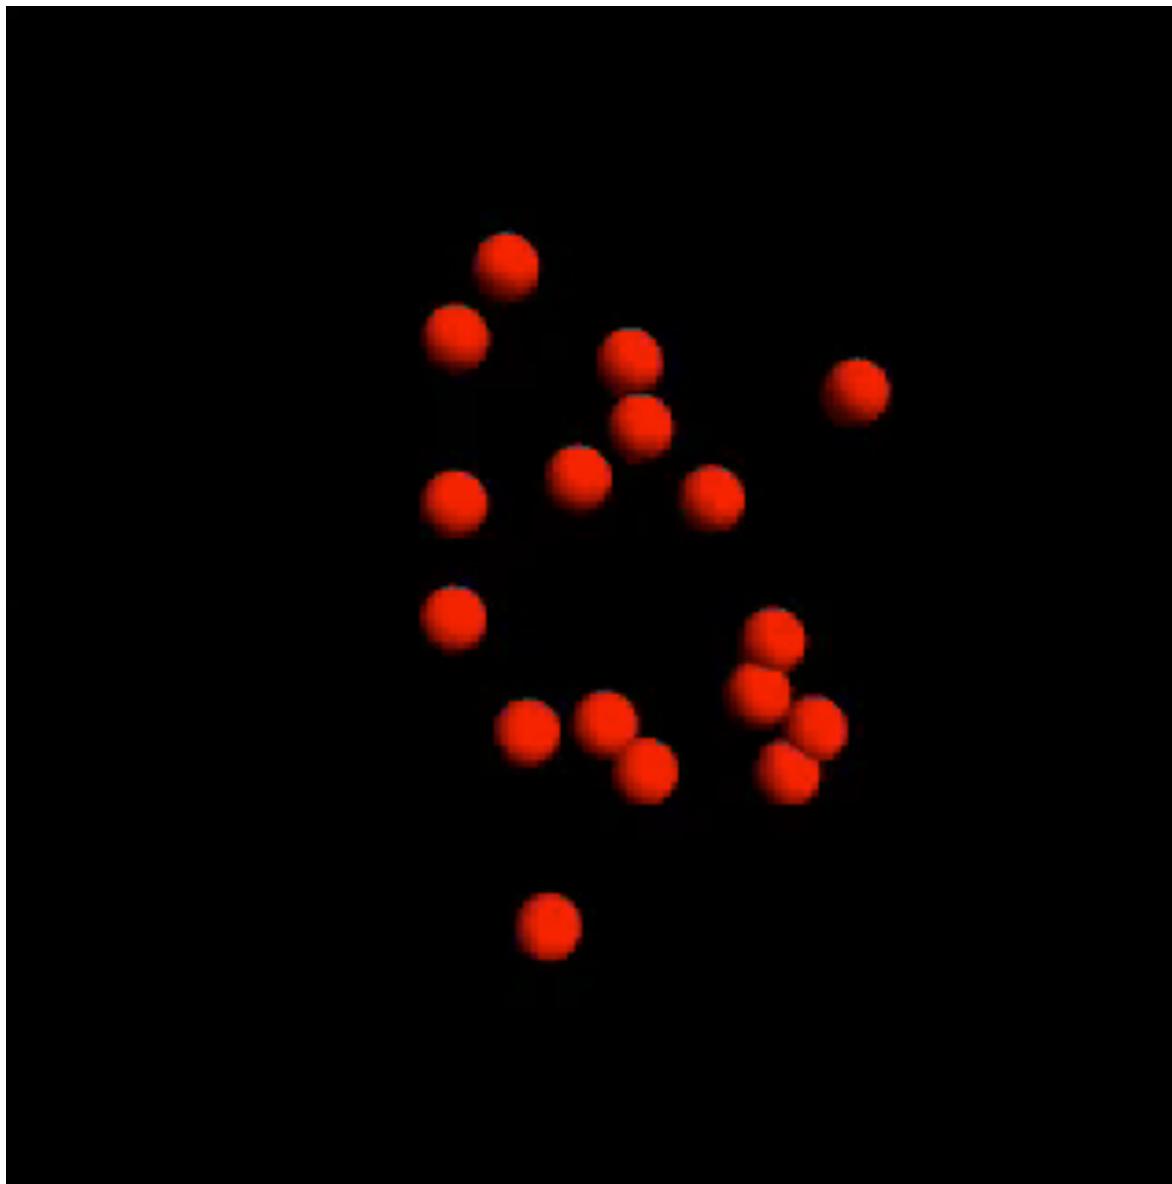

Let X be a state variable (e.g. positions of atoms $\in \mathbb{R}^{3N}$) and calculate the statistical average of function $A(X)$ with probability density $P(X) \propto e^{-V(X)/k_B T}$

```
Sum_A = 0
for n = 1 to Ntrial
    X' ← X + dX /* Random state-transition attempt */
    Compute dV = V(X') - V(X)
    if dV < 0 then /* Greedy */
        Accept X ← X'
    else if rand() < exp(-dV/k_B T) then /* Occasional uphill move */
        Accept X ← X'
    /* else the state remains X */
    endif
    Sum_A = Sum_A + A(X) /* Count X more than once, if it remains */
endfor
Avg_A = Sum_A/Ntrial
```

Note: `rand()` here is a uniform random number in the range [0, 1]

Monte Carlo Simulation

$$V = \sum_{i < j} \frac{e^2}{|\vec{r}_i - \vec{r}_j|}$$

Random trial → acceptance by a cost criterion

Summary: Monte Carlo Basics

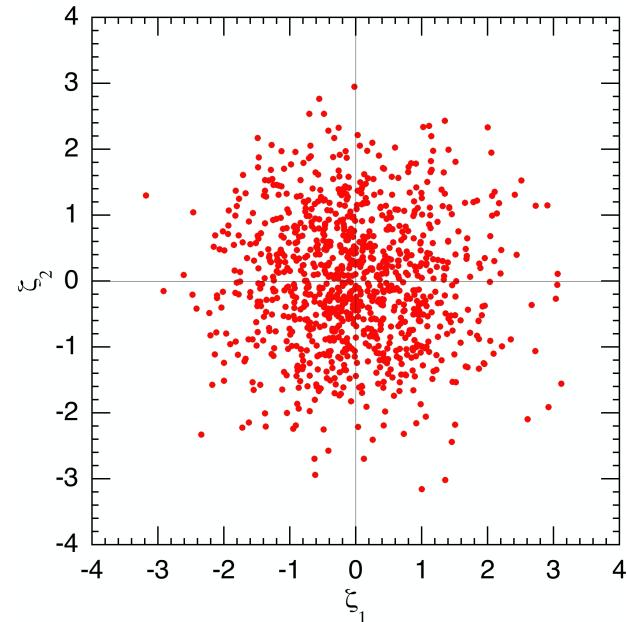

1. Sample-mean MC

$$\int dx f(x) p(x) \cong \bar{f} \pm \sqrt{\frac{\bar{f}^2 - (\bar{f})^2}{M - 1}}$$

2. Visualize probability density by a set of points: nonuniform random-number generation by coordinate transformation

$$P'(\zeta_1, \dots, \zeta_N) = \frac{P(r_1, \dots, r_N)}{|\partial(\zeta_1, \dots, \zeta_N)/\partial(r_1, \dots, r_N)|}$$

Areal magnification factor

3. Metropolis (Markov-chain) MC algorithm for importance sampling

Random attempt → conditional acceptance with probability $\exp(-\Delta V/k_B T)$
