System: A Set of Point Atoms

Math symbol

$$\{\vec{r}_i = (x_i, y_i, z_i) \mid x_i, y_i, z_i \in \mathfrak{R}, i = 0, \dots, N - 1\}$$

Variable int nAtom: N , Number of atoms.

NMAX: Maximum number of atoms.

double r[NMAX][3]: $r[i][0 | 1 | 2] = x_i | y_i | z_i$.

Trajectory

- Trace of atom positions

$t \in \Re \mapsto \vec{r}_i(t) \in \Re^3$
Mapping

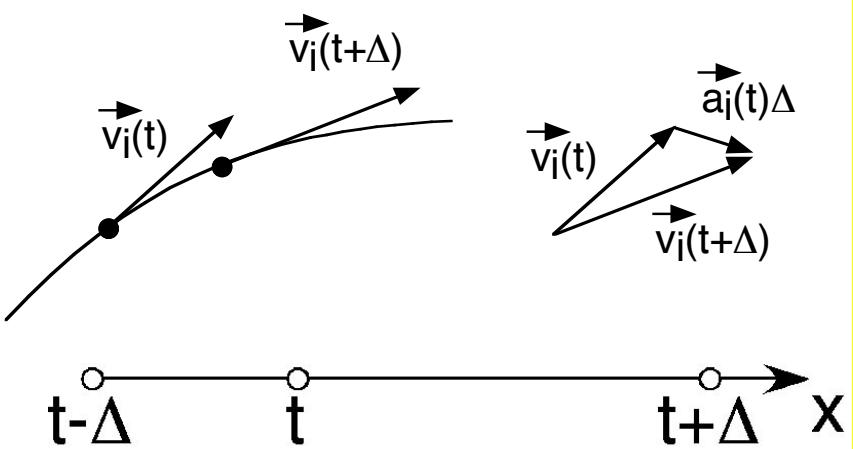

- Velocity $\vec{v}_i(t) = \dot{\vec{r}}_i(t) = \frac{d\vec{r}_i}{dt} \equiv \lim_{\Delta \rightarrow 0} \frac{\vec{r}_i(t + \Delta) - \vec{r}_i(t)}{\Delta}$ 2-point difference

- Acceleration $\vec{a}_i(t) = \ddot{\vec{r}}_i(t) = \frac{d^2\vec{r}_i}{dt^2} = \frac{d\vec{v}_i}{dt} \equiv \lim_{\Delta \rightarrow 0} \frac{\vec{v}_i(t + \Delta) - \vec{v}_i(t)}{\Delta}$

double ra[NMAX][3]: $ra[i][0 | 1 | 2] = a_{ix} | a_{iy} | a_{iz}$

It's vector arithmetic

$$\begin{aligned}
 \vec{a}_i(t) &= \lim_{\Delta \rightarrow 0} \frac{\vec{v}_i(t + \Delta/2) - \vec{v}_i(t - \Delta/2)}{\Delta} \\
 &= \lim_{\Delta \rightarrow 0} \frac{\frac{\vec{r}_i(t + \Delta) - \vec{r}_i(t)}{\Delta} - \frac{\vec{r}_i(t) - \vec{r}_i(t - \Delta)}{\Delta}}{\Delta} \\
 &= \lim_{\Delta \rightarrow 0} \frac{\vec{r}_i(t + \Delta) - 2\vec{r}_i(t) + \vec{r}_i(t - \Delta)}{\Delta^2} \quad \text{3-point difference}
 \end{aligned}$$

Newton's Equation of Motion

Trajectory is determined by Newton's 2nd law:

$$\text{mass} \longrightarrow m\ddot{\vec{r}}_i(t) = \vec{F}_i(t) \longleftarrow \text{force}$$

- **Initial value problem:** Given initial particle positions & velocities $\{(\vec{r}_i(0), \vec{v}_i(0)) | i = 0, \dots, N-1\}$, obtain those at later times $\{(\vec{r}_i(t), \vec{v}_i(t)) | i = 0, \dots, N-1; t > 0\}$ by numerically integrating Newton's equation of motion
- **Force from potential energy:** $\vec{F}_k = -\frac{\partial}{\partial \vec{r}_k} V(\vec{r}^N) = -\left(\frac{\partial V}{\partial x_k}, \frac{\partial V}{\partial y_k}, \frac{\partial V}{\partial z_k}\right)$

where the partial derivative is

$$\frac{\partial V}{\partial x_k} = \lim_{h \rightarrow 0} \frac{V(x_0, y_0, z_0, \dots, \cancel{x_k + h}, y_k, z_k, \dots, x_{N-1}, y_{N-1}, z_{N-1}) - V(x_0, y_0, z_0, \dots, \cancel{x_k}, y_k, z_k, \dots, x_{N-1}, y_{N-1}, z_{N-1})}{h}$$

“for all pairs of atoms”

- **Pair potential:** $V(\vec{r}^N) = \sum_{i < j} u(r_{ij}) = \sum_{i=0}^{N-2} \sum_{j=i+1}^{N-1} u(|\vec{r}_{ij}|)$

$$\vec{r}_{ij} = \vec{r}_i - \vec{r}_j$$

$$V(\vec{r}^N) = \sum_{i < j} u(r_{ij}) = \sum_{i=0}^{N-2} \sum_{j=i+1}^{N-1} u(|\vec{r}_{ij}|)$$

where $\vec{r}_{ij} = \vec{r}_i - \vec{r}_j$ and

Normalization

For Argon atoms:

$$> m = 6.6 \times 10^{-23} \text{ gram}$$

$$> \varepsilon = 1.66 \times 10^{-14} \text{ erg} (\text{erg} = \text{gram} \cdot \text{cm}^2/\text{second}^2)$$

$$> \sigma = 3.4 \times 10^{-8} \text{ cm}$$

Define length, energy & time units as

$$\begin{cases} \vec{r}_i = \vec{r}'_i \sigma = 3.4 \times 10^{-8} [\text{cm}] \times \vec{r}'_i \\ V = V' \varepsilon = 1.66 \times 10^{-14} [\text{erg}] \times V' \\ t = \sigma \sqrt{m / \varepsilon} t' = 2.2 \times 10^{-12} [\text{sec}] \times t' \end{cases}$$

$$\begin{aligned} & 1.66 \times 10^{-14} \text{ erg} \\ & = 3.97 \times 10^{-25} \text{ kcal} \\ & = 7.35 \times 10^{-28} \text{ Big Mac} \end{aligned}$$

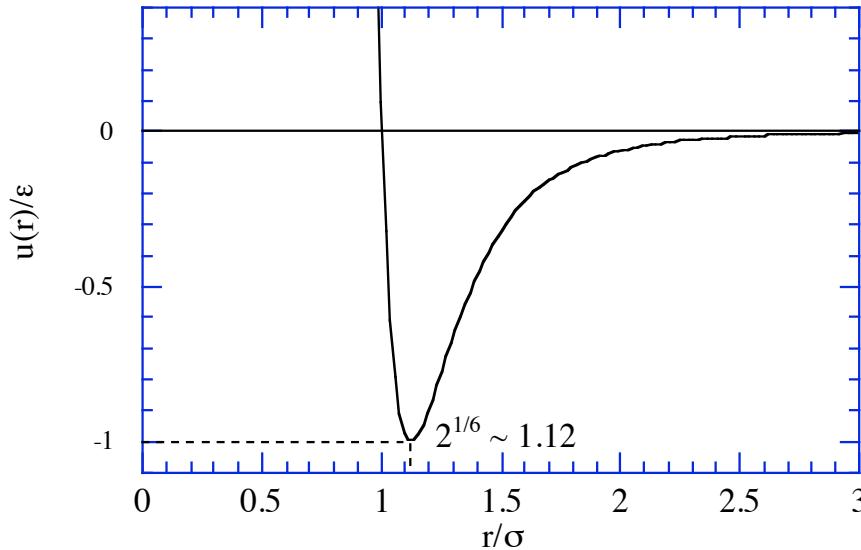

The equation of motion in these units:

$$\frac{d^2 \vec{r}_i}{dt^2} = -\frac{\partial V}{\partial \vec{r}_i} = \vec{a}_i$$
$$V(\vec{r}^N) = \sum_{i < j} u(r_{ij})$$
$$u(r) = 4 \left(\frac{1}{r^{12}} - \frac{1}{r^6} \right)$$

Repulsion vs. Attraction

$$u(r) = 4 \left(\frac{1}{r^{12}} - \frac{1}{r^6} \right)$$

$$\frac{du}{dr} = 4 \left(-\frac{12}{r^{13}} + \frac{6}{r^7} \right) = -\frac{48}{r^7} \left(\frac{1}{r^6} - \frac{1}{2} \right)$$

Correlations in the Motion of Atoms in Liquid Argon*

A. RAHMAN

Argonne National Laboratory, Argonne, Illinois

(Received 6 May 1964)

A system of 864 particles interacting with a Lennard-Jones potential and obeying classical equations of motion has been studied on a digital computer (CDC 3600) to simulate molecular dynamics in liquid argon at 94.4°K and a density of 1.374 g cm^{-3} .

Aneesur Rahman—Father of molecular dynamics

Argonne physicist Aneesur Rahman, known worldwide as the “father of molecular dynamics,” pioneered the application of computer science to physical systems.

In 1960, Rahman successfully modeled the behavior of a cluster of 864 argon atoms on a computer that could perform only 150,000 calculations per second.

While Argonne's new IBM Blue Gene ® /P supercomputer runs nearly 3 million times faster than Rahman's CDC 3600, today's scientists still base the code for their models on Rahman's algorithms.

Since 1993, the [American Physical Society](#) has annually awarded the Aneesur Rahman Prize for outstanding achievement in computational physics research.

Velocity Verlet Algorithm

Theorem: The following algebraic equation gives the same sequence of states, $(\vec{r}_i(n\Delta), \vec{v}_i(n\Delta))$, as that obtained by the Verlet discretization (see [lecture note p. 7](#) for a proof and the velocity error).

$$\begin{cases} \vec{r}_i(t + \Delta) = \vec{r}_i(t) + \vec{v}_i(t)\Delta + \frac{1}{2}\vec{a}_i(t)\Delta^2 + O(\Delta^4) \\ \vec{v}_i(t + \Delta) = \vec{v}_i(t) + \frac{\vec{a}_i(t) + \vec{a}_i(t + \Delta)}{2}\Delta + O(\Delta^3) \end{cases}$$

Shifted Potential

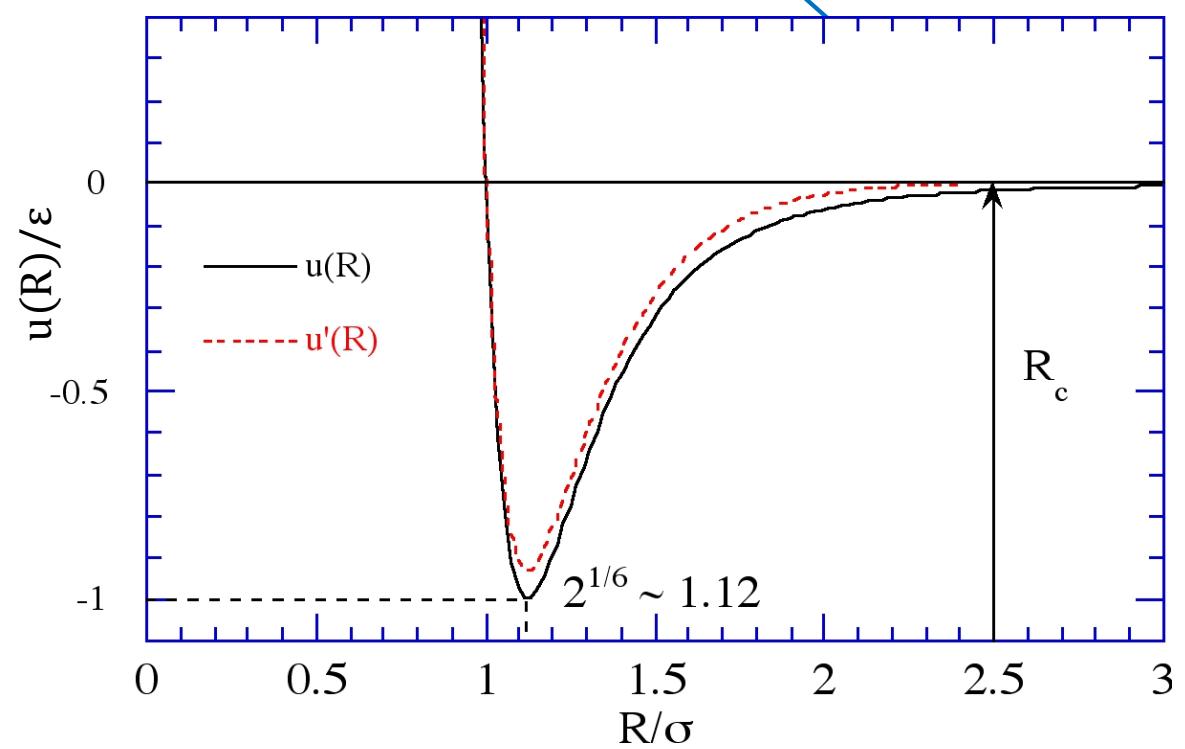

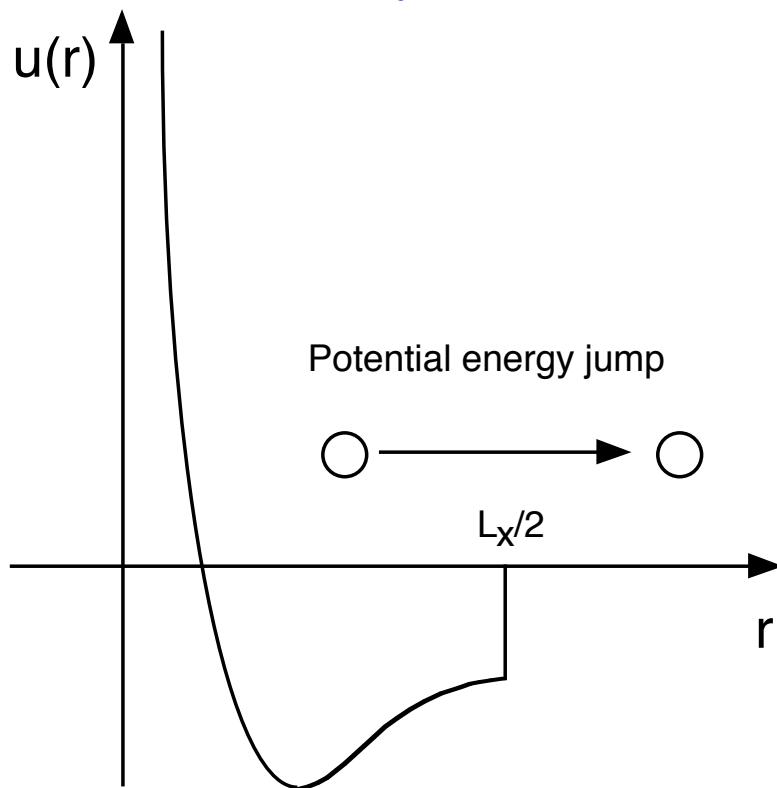

- Truncate the interaction $u(r)$ at a cut-off radius $r_c < \min(L_x, L_y, L_z)/2$ to make the minimal image convention exact
- Shift the potential to make $u(r)$ & du/dr continuous at $r = r_c$

$$u'(r) = \begin{cases} u(r) - u(r_c) - (r - r_c) \frac{du}{dr} \Big|_{r=r_c} & r < r_c \\ 0 & r \geq r_c \end{cases}$$

$$u'(r) = u(r) - u(r_c) - (r - r_c) \frac{du}{dr} \Big|_{r=r_c} \xrightarrow[r \rightarrow r_c]{} 0$$

$$\frac{du'}{dr} = \frac{du}{dr} - \frac{du}{dr} \Big|_{r=r_c} \xrightarrow[r \rightarrow r_c]{} 0$$

- We take $r_c = 2.5\sigma$ for the Lennard-Jones potential

Liouville's Theorem

- Phase-space trajectory as a mapping

$$(x, p) \rightarrow (x', p')$$
$$t \qquad t + \Delta$$

- Phase-space volume conservation: Jacobian of the mapping (areal enlargement factor) = 1

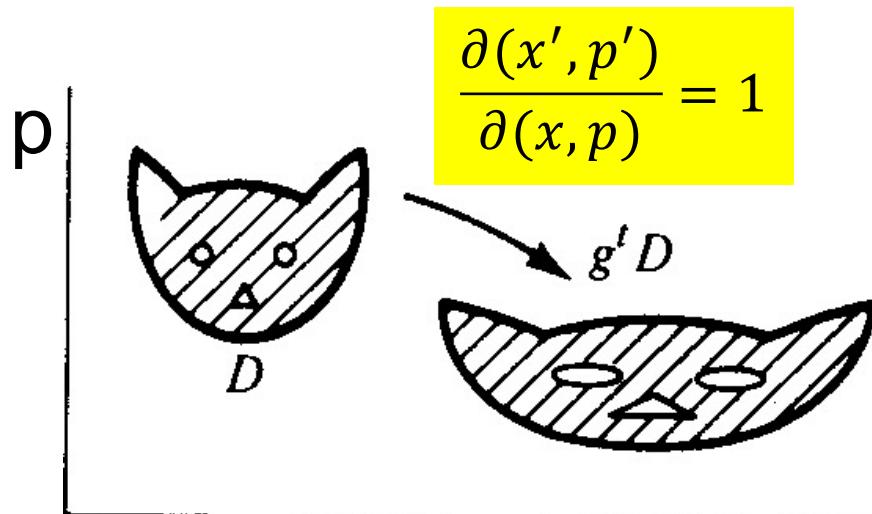

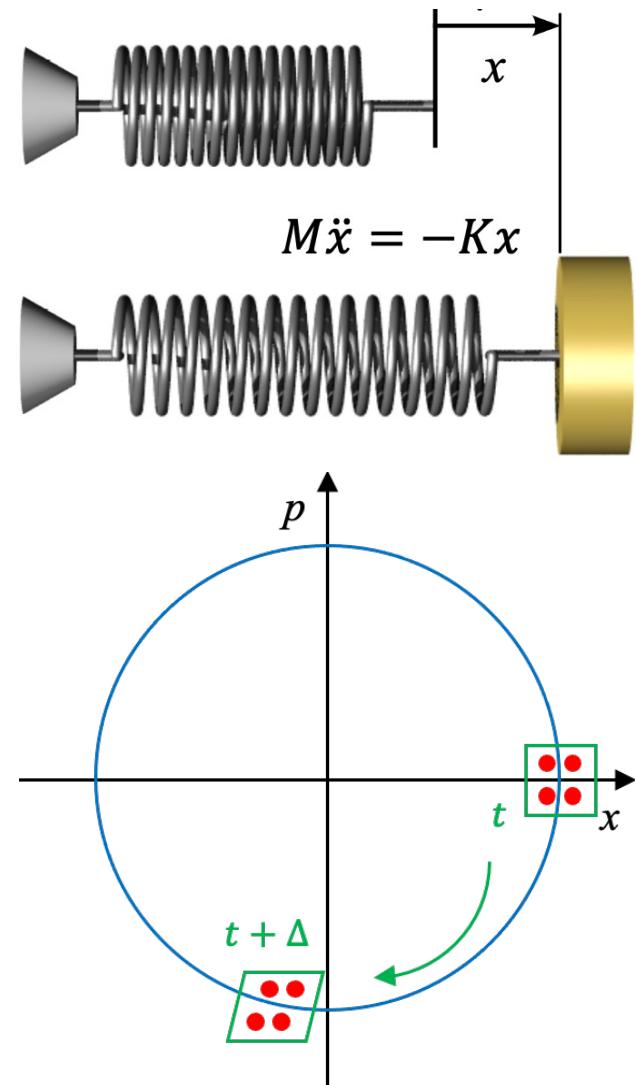

Figure 48 Conservation of volume \times

V. I. Arnold, *Mathematical Methods of Classical Mechanics*, 2nd Ed. (Springer, '89)

- The cat is a phase-space volume occupied by an ensemble of phase-space points, each representing a specific instance of the initial condition (see `anim_spring.c`)

Velocity Verlet Algorithm in 1D

$$\begin{cases} x' \leftarrow x + p\Delta + \frac{1}{2}a(x)\Delta^2 \equiv x'(x, p) \\ p' \leftarrow p + \frac{a(x) + a(x + p\Delta + \frac{1}{2}a(x)\Delta^2)}{2}\Delta \equiv p'(x, p) \end{cases}$$

Bottom-line: Velocity Verlet algorithm “exactly” satisfies Liouville’s theorem

Prove phase-space volume conservation: $\frac{\partial(x', p')}{\partial(x, p)} = 1$

What phase-space volume conservation means? It’s ensemble!

Compare an algorithm variant, Euler:

$$\begin{cases} x' \leftarrow x + p\Delta + \frac{1}{2}a(x)\Delta^2 \\ p' \leftarrow p + a(x)\Delta \end{cases}$$

$$\rightarrow \frac{\partial(x', p')}{\partial(x, p)} \neq 1$$
